(a) Size of the two-sided Wald test, PATTERN-DIF
pool-conditional test of pool value
pool-conditional test of population value
two-phase test of population value
rejection rate at nominal 5% (mean over 108 contrasts)
median $\hat{V}_{pool}/\hat{V}_{design}$
(b) Familywise error of the 108-contrast family, PATTERN-DIF
Unadjusted
Bonferroni (= Holm)
Max-t
FWER, all 108 population nulls true
pool size N (upper) and budget L (lower)
(c) Label-budget ratio for 80% power
Synthetic pool
Adult (sex)
Adult (race)
Bank marketing
Credit card
MAGIC
EEG eye state
Phoneme
Electricity
observed L_{SRS}/L_{DIF} (80% power)
predicted L_{SRS}/L_{DIF} (oracle variances)
(d) Worst-case power: filled = E2 (common effect 0.05), open = E1 (effect $|\theta_k|$)
default allocation
maximin allocation
minimum power over targeted contrasts
